TITLEFUNGICIDAL PYRAZOLES, PYRAZOLINES AND  
TETRAHYDROPYRIDAZINES

5

FIELD OF THE INVENTION

The present invention relates to novel fungicides, their salts and metal complexes thereof, processes for their production, fungicidal compositions containing them, and a fungicidal method for applying them.

10

BACKGROUND OF THE INVENTION

New fungicides for controlling fungus growth on vegetation are in constant demand. In the most common situation, such compounds are sought to selectively control fungus growth on useful crops such as cotton, rice, corn, wheat and soybeans, to name a few. Unchecked fungus growth in such crops can cause significant losses, reducing profit to the farmer and increasing costs to the consumer. There are many products commercially available for these purposes, but the search continues for products which are more effective, less costly and environmentally safe.

20

A number of fungicides have been developed and employed. For example, U.S. 3,920,646 discloses the compound

25

as an anti-inflammatory agent.

Konishi et al. (*J. Pest. Sci.* 1990, 15, 13-22)  
disclose fungicidal pyrazolylpyrimidines of the formula

5

wherein  $R_1$ - $R_6$  are H, alkyl, aryl or alkenyl. Alkyl substitution enhanced the fungicidal activity in both pyrazole and pyrimidine rings. The activity was impaired by introduction of a phenyl group on the pyrazole ring.

#### SUMMARY OF THE INVENTION

DETAILED DESCRIPTION OF THE INVENTIONSynthesis

Compounds of Formula I where E is as described previously with the exception of halogen, phenoxy, phenylthio, phenylamino, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> alkylthio and C<sub>1</sub>-C<sub>6</sub> haloalkoxy, and R<sup>1</sup> and R<sup>2</sup> are as described previously, can be prepared by one or more of the methods described in Equations 1 to 14.

As shown in Equation 1 below, compounds of Formula Ia can be prepared by deprotonation of compounds of Formula Ib with a strong base such as lithium diisopropyl amide (LDA) followed by addition of R<sup>2</sup>-L where L is a leaving group such as Cl, Br, I, OSO<sub>2</sub>CH<sub>3</sub> or OSO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CH<sub>3</sub>. The reaction is carried out at about -78° to about 100°C in an inert, aprotic solvent such as tetrahydrofuran (THF) or dimethoxyethane (DME).

Equation 1

Compounds of Formula Ib can be prepared by reacting hydrazine 1 with 2 as shown below in Equation 2. The reaction is carried out at about 50° to about 100°C in a lower alcohol solvent such as ethanol or 2-propanol.

14

Equation 2LG = Cl, NMe<sub>2</sub>, NMe<sub>2</sub> • HCl

A base such as sodium hydroxide is added if necessary.

- 5 The hydrazines 1 can be prepared by treating a compound of Formula 3 with hydrazine monohydrate as taught in EP293743-A and by Naito et al. (Chem. Pharm. Bull. 1969, 17, 1467-1478). Compounds of Formula 2 are either commercially available or can be prepared by methods described in Carey, F.A.; Sundberg, R.J. Advanced Organic Chemistry; plenum:New York, 1983; Part B, pp. 58-62:
- 10

X = Cl, SH

- 15 Compounds of Formulae Ic, Id and Ie can be prepared by reacting 1 with  $\alpha,\beta$ -unsaturated ketones 4, 5 or 6 as shown below in Equations 3, 4 and 5. The reaction is carried out at 50°C to 100°C in a lower alcohol solvent such as ethanol or 2-propanol in the presence of a catalytic amount of an acid, such as hydrochloric acid.
- 20 Compounds of Formulae 4, 5 and 6 are well known in the literature and can be prepared by methods known to one skilled in the art.

Equation 5

10

As shown below in Equation 6, compounds of Formula If can be prepared from compounds of Formula Ig according to the procedure described previously for Formula Ib.

Equation 6

Compounds of Formula Ig can be prepared by reacting 1  
 5 and 7 as shown below in Equation 7. The reaction is  
 carried out at 25° to 100°C in an organic solvent such as  
 ethanol, 2-propanol, acetonitrile or *N,N*-dimethyl-  
 formamide in the presence of a catalytic amount of an  
 acid such as toluenesulfonic acid and a drying agent such  
 10 as molecular sieves (3Å). This reaction can also be  
 carried out in two steps. The first step involves the  
 formation of the hydrazone from ketone 7 and hydrazine 1  
 in an organic solvent such as acetic acid or  
 acetonitrile. The hydrazone product is isolated and  
 15 dissolved in an inert solvent such as THF. Treatment  
 with sodium hydride provides Ig. If acetonitrile is used  
 as the solvent, potassium carbonate can be used as the  
 base instead of sodium hydride.

Equation 7

Compounds of Formula 17 can be prepared from keto esters 8 and ethylene oxide using the general method described by Cannon et al. (*Org. Syn.*, Coll. Vol. IV, 1963, 597-600).

Compounds of Formula 7a, wherein E is an aromatic group optionally substituted with R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup>, and R<sup>1</sup> is H, alkyl, halogen, or haloalkyl, can be prepared by Friedel-Crafts acylation of the parent compound E-H with an R<sup>1</sup>-substituted 4-chlorobutyryl chloride according to the procedure set out in the literature (for example, see Close; *J. Am. Chem. Soc.*, 1957, 79, 1455) and illustrated below.

The corresponding chlorobutyryl chloride can be prepared by reacting  $\gamma$ -butyrolactone with thionyl chloride in the presence of zinc chloride according to the procedure taught by Goel et al. (*Synthesis*, 1973, 538; see Equation below).

Compounds of Formula 7a can also be prepared by  
 condensing  $\gamma$ -butyrolactone with an ester followed by  
 5 alkylation with  $\text{R}^1\text{X}$  and treatment of the alkylated  
 product with hydrochloric acid.

10 Similarly, compounds of Formulae Ih, Ii, Ij, and Ik  
 can be prepared by the same method from the corresponding  
 keto esters and oxiranes as shown below in Equations 8, 9  
 and 10. The stereoisomers obtained in the reactions can  
 be separated by chromatography.

Equation 14

As shown in Equation 15, compounds of Formula IIb, where R<sup>1</sup> and R<sup>2</sup> are substituted at different carbons, can be prepared by reacting compounds of Formula 13 with ketone 15a or 15b according to the method described for Formula IIa.

Equation 15

As shown in Equation 16, compounds of Formula IIc can be prepared from compounds of Formula 13 and ketone 16 according to the procedure described for Formula IIa. Deprotonation of Formula IIc with a base such as LDA followed by alkylation with R<sup>2</sup>-L provides compounds of Formula IIId.

Pyrazoles of Formula III can be prepared as shown below in Equation 17 from a pyrazole salt 19a such as the sodium salt, with a heterocycle 20 containing an activated leaving group such as a halogen in an organic solvent such as THF. This method allows the preparation of pyrazoles III with large substituents E in the 3-position.

The salt 19a is prepared from the pyrazole 19b and an organometallic such as sodium hydride.

#### EXAMPLE 6

Synthesis of 3-(3,4-dimethylphenyl)-1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetrahydropyridazine

To a stirred solution of 4,6-dimethyl-2-hydrazino-pyrimidine (500 mg, 3.62 mmol) in 7.2 mL of acetic acid under nitrogen is added 4-chloro-1-(3,4-dimethyl-phenyl)-1-butanone (763 mg, 3.62 mmol). The organic extracts are combined, dried ( $\text{MgSO}_4$ ) and concentrated. The residue is purified by chromatography to give 115 mg (65% yield over 2 steps) of the title compound as a solid: mp 119-120°C.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  2.1

5        Synthesis of 3-(3,4-dimethylphenyl)-1-  
         (4,6-dimethyl-2-pyrimidinyl)hexahydropyridazine  
A solution of 1-(4,6-dimethyl-2-pyrimidinyl)-3-(3,4-  
dimethylphenyl)-1,4,5,6-tetrahydropyridazine (0.30 g,  
1.02 mmol) in anhydrous 1,2-dimethoxyethane (5 mL) is  
10 added dropwise to a mixture of titanium (IV) chloride  
(1.5 mmol, 1.5 mL) and sodium borohydride (3.06 mmol,  
0.12 g) at 0°C in 10 mL of 1,2-dimethoxyethane. The  
reaction mixture is allowed to warm to room temperature  
and is stirred for 16 h. The reaction is then quenched

bicarbonate and extracted three times with  
dichloromethane. The combined organic extracts are  
washed with brine, dried over sodium sulfate and

25        Synthesis of 3-(4-chlorophenyl)-1-(4,6-  
         dimethyl-2-pyrimidinyl)-1,4,5,6-  
         tetrahydropyridazine, complex with zinc chloride  
A solution of 302 mg (1.00 mmol) of 3-(4-  
chlorophenyl)-1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-  
tetrahydropyridazine in 5 mL of ether and 5 mL of  
30 tetrahydrofuran is treated with 1.0 mL of 1.0M ZnCl<sub>2</sub> in  
ether at room temperature. As the addition proceeds, a  
white crystalline precipitate begins to form. The  
reaction mixture is stirred at room temperature for 18 h  
and then concentrated in vacuo to yield 0.46 g of a white

crystalline solid, mp 231-232°C. This material is crystallized from dichloromethane to yield white needles. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz): 7.78 (d, 8.5 Hz, 2H); 7.52 (d, 8.5 Hz, 2H); 6.71 (s, 1H); 4.31-4.25 (m, 2H); 2.92 (t, 6.4 Hz, 2H); 2.66 (s, 3H); 2.48 (s, 3H); 2.26-2.16 (m, 2H).

#### EXAMPLE 11

##### Synthesis of 3-(4-chlorophenyl)-1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetrahydropyridazine, complex with copper (II) chloride

A solution of 401 mg (1.33 mmol) of 3-(4-chlorophenyl)-1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetrahydropyridazine in 8 ml of tetrahydrofuran is treated with 179 mg of anhydrous CuCl<sub>2</sub> dissolved in 4 ml of absolute methanol. The reaction mixture immediately acquires a dark olive-green color and is stirred at room temperature for 18 h. After concentration *in vacuo*, the resulting residue is triturated with ether several times, concentrating *in vacuo* each time. A total of 0.55 g of a free-flowing emerald green solid is thus obtained, mp 135-138°C. Crystallization from dichloromethane results in emerald green prisms.

Formulations

Useful formulations of the compounds of Formulae I-VI can be prepared in conventional ways in the form of dusts, granules, pellets, solutions, suspensions, emulsions, wettable powders, emulsifiable concentrates and the like. Many of these formulations may be applied directly. Sprayable formulations can be extended in suitable media and used at spray volumes of from a few liters to several hundred liters per hectare. High strength compositions are primarily used as intermediates for further formulation. The formulations, broadly, contain about 0.1% to 99% by weight of active ingredient(s) and at least one of (a) about 0.1% to 20% surfactant(s) and (b) about 1% to 99.9% solid or liquid inert diluent(s). More specifically, they may contain these ingredients in the following approximate proportions:

	<u>Formulation</u>	<u>Weight Percent*</u>	
		<u>Ingredient</u>	<u>Diluent(s) Surfactant(s)</u>
20	Wettable Powders	20-90	0-74 1-10
25	Oil Suspensions, Emulsions, Solutions, (including Emulsifiable Concentrates)	3-50	40-95 0-15
30	Aqueous Suspension	10-50	40-84 1-20
	Dusts	1-25	70-99 0-5
	Granules and Pellets	0.1-95	5-99.9 0-15
35	High Strength Compositions	90-99	0-10 0-2

\*Active ingredients plus at least one of a surfactant or a diluent equals 100 weight percent.

Lower or higher levels of active ingredient can, of course, be present depending on the intended use and the

physical properties of the compound. Higher ratios of surfactant to active ingredient are sometimes desirable, and are achieved by incorporation into the formulation or by tank mixing.

- 5        Typical solid diluents are described in Watkins et al., "Handbook of Insecticide Dust Diluents and Carriers", 2nd Ed., Dorland Books, Caldwell, New Jersey, but other solids, either mined or manufactured, may be used. The more absorptive diluents are preferred for  
10        wettable powders and the denser ones for dusts. Typical liquid diluents and solvents are described in Marsden, "Solvents Guide", 2nd Ed., Interscience, New York, 1950. Solubility under 0.1% is preferred for suspension concentrates; solution concentrates are preferably stable  
15        against phase separation at 0°C. "McCutcheon's Detergents and Emulsifiers Annual", MC Publishing Corp., Ridgewood, New Jersey, as well as Sisely and Wood, "Encyclopedia of Surface Active Agents", Chemical Publishing Co., Inc., New York, 1964, list surfactants and  
20        recommended uses. All formulations can contain minor amounts of additives to reduce foaming, caking, corrosion, microbiological growth, etc.

- The methods of making such compositions are well known. Solutions are prepared by simply mixing the  
25        ingredients. Fine solid compositions are made by blending and, usually, grinding as in a hammer or fluid energy mill. Suspensions are prepared by wet milling (see, for example, U.S. Patent 3,060,084). Granules and pellets may be made by spraying the active material upon  
30        preformed granular carriers or by agglomeration techniques. See J.E.Browning, "Agglomeration", Chemical Engineering, December 4, 1967, pp. 147ff and "Perry's Chemical Engineer's Handbook", 5th Ed., McGraw-Hill, New York, 1973, pp. 8-59ff.

For further information regarding the art of formulation, see for example:

- U.S. Patent 3,235,361;  
U.S. Patent 3,309,192;  
5 U.S. Patent 2,891,855; and

J. D. Fryer et al., "Weed Control Handbook", 5th Ed., Blackwell Scientific Publications, Oxford, 1968, pp. 101-  
10 103.

In the following examples of formulations, all parts are by weight unless otherwise indicated.

EXAMPLE A

Wettable Powder

- 15 1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetrahydro-3-phenylpyridazine 50%  
sodium alkyl naphthalenesulfonate 2%  
sodium ligninsulfonate 5%  
diatomaceous earth 43%  
20 The ingredients are blended, coarsely hammer-milled and then air-milled to produce particles essentially all below 10 microns in diameter. The product is reblended before packaging.

EXAMPLE B

25 Granule

- Oily active ingredient 5%  
attapulgate granules 95%  
(U.S.S. 20-40 mesh; 0.84-0.42 mm)

- An oily active ingredient is sprayed on the surface  
30 of attapulgate granules in a double-cone blender. The granules are dried and packaged.

EXAMPLE COil Suspension

	1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-	
	hydro-3-phenylpyridazine	25%
5	polyoxyethylene sorbitol hexaoleate	5%
	highly aliphatic hydrocarbon oil	70%

The ingredients are ground together in a sand mill until the solid particles have been reduced to under about 5 microns. The resulting thick suspensions may be applied directly, but preferably after being extended with oils or emulsified in water.

EXAMPLE DWettable Powder

	1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-	
15	hydro-3-phenylpyridazine	20%
	sodium alkyl naphthalenesulfonate	4%
	sodium ligninsulfonate	4%
	low viscosity methyl cellulose	3%
	attapulgate	69%

The ingredients are thoroughly blended. After grinding in a hammer-mill to produce particles essentially all below 100 microns, the material is reblended and sifted through a U.S.S. No. 50 sieve (0.3 mm opening) and packaged.

EXAMPLE ELow Strength Granule

	1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-	
	hydro-3-phenylpyridazine	1%
	methylene chloride	9%
30	attapulgate granule	90%
	(U.S.S. 20-40 sieve)	

The active ingredient is dissolved in the solvent and the solution is sprayed upon dedusted granules in a double cone blender. After spraying of the solution has

been completed, the blender is allowed to run for a short period. The product is then gently dried to remove solvent and the granules are packaged.

EXAMPLE F

5 Aqueous Suspension

1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-

hydro-3-phenylpyridazine 10%

polyacrylic acid thickener 0.3%

dodecylphenol polyethylene glycol 5.0%

10 ether

disodium phosphate 1%

monosodium phosphate 0.5%

polyvinyl alcohol 1.0%

water 82.2%

15 The ingredients are blended and milled together in a homogenizer to produce particles essentially all under 5 microns in size.

EXAMPLE G

Solution

20 1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-

hydro-3-phenylpyridazine 5%

water 95%

The salt is added directly to the water with stirring to produce the solution, which may then be packaged for  
25 use.

EXAMPLE H

Low Strength Granule

1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-

hydro-3-phenylpyridazine 0.1%

30 attapulgite granules 99.9%

(U.S.S. 20-40 mesh)

The active ingredient is dissolved in a solvent and the solution is sprayed upon dedusted granules in a double cone blender. After spraying of the solution has

been completed, the material is warmed to evaporate the solvent. The material is allowed to cool and then packaged.

#### EXAMPLE I

##### 5 Emulsion Concentrate

1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-  
hydro-3-phenylpyridazine 35%  
blend of polyalcohol carboxylic 6%  
esters and oil soluble petroleum  
10 sulfonates  
xylene 59%

The ingredients are combined and stirred together to produce a solution. The product can be extended with oils, or emulsified in water.

##### 15 EXAMPLE J

##### Emulsifiable Concentrate

1-(4,6-dimethyl-2-pyrimidinyl)-1,4,5,6-tetra-  
hydro-3-phenylpyridazine 20%  
chlorobenzene 74%  
20 sorbitan monostearate and polyoxy- 6%

#### Application Method

- Disease control is ordinarily accomplished by  
15 applying an effective amount of the compounds of the  
invention either pre-infection or post-infection to the  
portion of the plant to be protected such as the roots,  
stems, foliage, fruit, seeds, tubers or bulbs, or to the  
media (soil or sand) in which the plants to be protected  
20 are growing. The compound also may be applied to the  
seed to protect the seed and seedling.

- Rates of application for these compounds can be  
influenced by many factors of the environment and should  
be determined under actual use conditions. Foliage can  
25 normally be protected when treated at a rate of from less  
than 1 g/ha to 5000 g/h of active ingredient. Plants  
growing in soil treated at a concentration from 0.1 to  
about 20 kg/ha can be protected from disease. Seed and  
seedlings can normally be protected when seed is treated  
30 at a rate of from 0.1 to 10 g per kilogram of seed. The  
efficacy of the compounds for disease control is  
evaluated according to Tests A - F below.

Test A

The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point of run-off on wheat seedlings. The following day the seedlings are inoculated with a spore dust of Erysiphe graminis f. sp. tritici, (the causal agent of wheat powdery mildew) and incubated in a growth chamber at 20°C for 7 days, after which disease ratings are made.

Test B

The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point of run-off on wheat seedlings. The following day the seedlings are inoculated with a spore suspension of Puccinia recondita (the causal agent of wheat leaf rust) and incubated in a saturated atmosphere at 20°C for 24 h, and then moved to a growth chamber at 20°C for 6 days, after which disease ratings are made.

Test C

The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point of run-off on rice seedlings. The following day the seedlings are inoculated with a spore suspension of Pyricularia oryzae (the causal agent of rice blast) and incubated in a saturated atmosphere at 27°C for 24 h, and

then moved to a growth chamber at 30°C for 5 days, after which disease ratings are made.

#### Test D

5 The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point of run-off on tomato seedlings. The following day the  
10 seedlings are inoculated with a spore suspension of Phytophthora infestans (the causal agent of potato and tomato late blight) and incubated in a saturated atmosphere at 20°C for 24 h, and then moved to a growth chamber at 20°C for 5 days, after which disease ratings  
15 are made.

#### Test E

The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water  
20 containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point of run-off on grape seedlings. The following day the seedlings are inoculated with a spore suspension of Plasmopara viticola (the causal agent of grape downy  
25 mildew) and incubated in a saturated atmosphere at 20 C for 24 h, moved to a growth chamber at 20 C for 6 days, and then incubated in a saturated atmosphere at 20 C for 24 h, after which disease ratings are made.

#### Test F

30 The test compounds are dissolved in acetone in an amount equal to 3 % of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem 014 (polyhydric alcohol esters). This suspension is sprayed to the point

of run-off on cucumber seedlings. The following day the seedlings are inoculated with a spore suspension of Botrytis cinerea (the causal agent of gray mold on many crops) and incubated in a saturated atmosphere at 20 C for 48 h, and moved to a growth chamber at 20 C for 5 days, after which disease ratings are made.
